

BeThere - Copyright and Legal Issues Report

DRP02, 2026

This report acknowledges the third-party code and assets shipped in the BeThere touchpoint (an Expo React Native app for iOS / Android / web, with a Fastify / tRPC / Drizzle / Postgres backend), and the legal issues to consider on an official release. Build- and test-only tooling is listed separately; transitive dependencies are out of scope.

1. Third-party resources and their licences

Resource (grouped)	Licence	Ships?
React 19, React Native 0.81, React DOM, react-native-web	MIT	Yes
Expo SDK 54 and expo-* modules (auth-session, secure-store, notifications, font, web-browser, clipboard, etc.)	MIT	Yes
React Navigation 7 (native, stacks, tabs) and its bundled UI glyphs	MIT	Yes
react-native-screens, react-native-safe-area-context, datetimestpicker	MIT	Yes
tRPC 11 (client + server), Fastify 5 (+ cors / rate-limit), pg, pino, Zod	MIT	Yes
@clerk/clerk-expo, @clerk/backend	MIT	Yes
drizzle-orm	Apache-2.0	Yes
dotenv	BSD-2-Clause	Yes
@vercel/og (invite-link card images)	MPL-2.0	Yes
Fonts: Archivo, Inter, Space Mono (@expo-google-fonts)	MIT and OFL-1.1	Yes
PostgreSQL database engine	PostgreSQL (BSD-style)	Service
Build / test only: TypeScript, drizzle-kit, Biome, Jest, Babel, Metro, @types/*	MIT / Apache-2.0	No

No photography or icon packs are bundled, so no licensed "pictures" are in scope; the only third-party creative assets are the fonts above and React Navigation's small UI glyphs (MIT). Hosted services (Clerk, AWS, Vercel, Expo / EAS, GitHub Actions) run under commercial terms of service, discussed in section 4.

2. Licence implications

Every third-party library uses a permissive open-source licence - mostly MIT, with some Apache-2.0, BSD-2-Clause, MPL-2.0 and the PostgreSQL licence. Permissive means the team can use them freely, even in a closed commercial product, as long as it keeps the upstream copyright and licence notices (which a release would list in an in-app "Licences" screen). None are "copyleft" licences like the GPL, which would have forced BeThere's own code to be released too - so the team can keep the app closed.

3. Copyright and ownership

Copyright in the project's code and brand rests with the student authors (Team DRP_02). The substantive content on a live service is user-generated - group, plan and profile names, notes and RSVPs - and stays the users' copyright, so a release would set terms of service that license BeThere to display it while disclaiming ownership. Because BeThere is the team's own product, a release would also declare an explicit repository licence - most naturally a proprietary "all rights reserved" notice, given the intent to keep developing it, or a permissive licence such as MIT if the code were ever opened up.

4. Wider legal implications (on an official release)

The principal consideration is data protection: BeThere would handle personal data (names, emails, group membership and RSVPs), so an official release would operate under UK GDPR - a lawful basis, a privacy notice, data-subject rights, and a transfer mechanism for its US hosting (the UK IDTA or EU SCCs). It would also count as a user-to-user service under the Online Safety Act 2023, since members post free text and share invite links - bringing duties to risk-assess illegal content and to let users report and remove it. The app stores add their own terms, notably a required in-app account-deletion path.
